Team-Oriented Markdown

Open source · MIT

A GitHub Desktop for docs

Your markdown files, your Git repository, and a UI that makes that workflow pleasant for an entire team — no mandatory cloud, no lock-in, no subscription.

Features

Why TOM

Docs

GitHub

Download

The workspace: the file tree, the source and the preview — over the same .md files on disk.

Git as the product, not a plugin

The differentiator is not the editor. It is the Git workflow, designed for documentation and put on the surface of the app.

Rendered markdown diff

Changes shown over the formatted document — a removed paragraph struck through, a new one highlighted. Not +/- over raw text.

Branch workflow without ceremony

Switch branches and watch the docs change. Branch off for a single edit. Commit and push in one gesture, with a clear sign when the remote moved first.

History and section blame

Who wrote this paragraph, in which commit, in which pull request — surfaced where you are reading it, not in a terminal.

A diff you can actually read

No tool does this well today. TOM aligns blocks, not lines: the paragraph that changed is shown over the document it lives in, and the colours are muted enough that a whole page of changes still reads as a document rather than as a warning.

How the diff is built →

M2 — The differentiator

- A diff of the raw text, line by line, the way every other client shows it.
- + A diff over the rendered document: the paragraph that changed, shown where it lives, aligned block by block.

Full-text search over the space, backed by SQLite FTS5.

Why this exists

Engineering teams already keep their documentation as markdown inside Git repositories. Then they edit it with tools that fight that.

TODAY'S OPTION	WHAT IT COSTS YOU
Confluence / Notion	Paid, cloud-bound, disconnected from the code, weak versioning.
Obsidian + Git plugin	Git is a poorly integrated add-on; a personal-notes focus; a closed-source app.
VS Code + extensions	Hostile to anyone who is not a developer; no documentation experience — search, navigation, spaces.
MkDocs / Docusaurus	A read-only generated site; editing still happens in a code editor.

The quadrant — team docs, desktop, Git-native, open source — is empty.

chore: the four rules this is built on

Files are the truth

Plain .md on disk. VS Code, vim or the GitHub web UI edit the same files without breaking anything.

Local-first

No essential feature needs the network. Sync is git push and git pull — there is nothing else to sync.

Git is the backbone

Branch, diff, commit and history are the main UI. Learning it here is learning Git, not a private dialect.

Open source, MIT

Yours to read, fork and keep. No account, and no telemetry unless you switch it on.

Point TOM at a folder

A space is a folder inside a Git repository — usually the docs/ you already keep beside the code.
