Editor

Reading a document, and editing its source with the preview alongside.

Reading

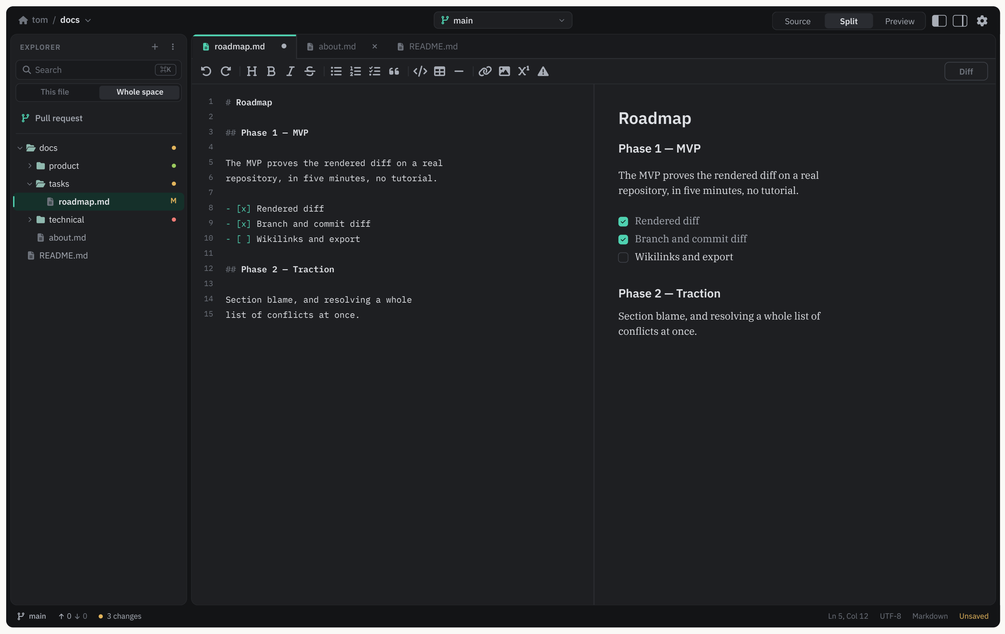

Reading

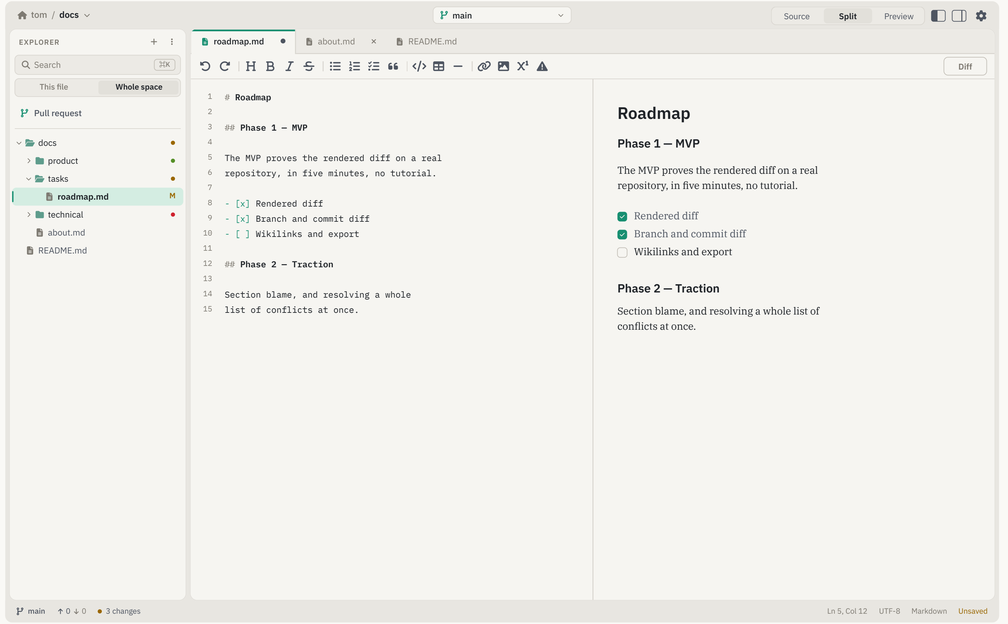

A first-class mode
Preview only, for whoever never opens the source.

Set wider, set larger
With the pane to itself the measure grows: reading is not a lesser mode.

Everything renders
Headings, lists, tables, highlighted code, local images and links.

Unsaved changes

Unsaved changes

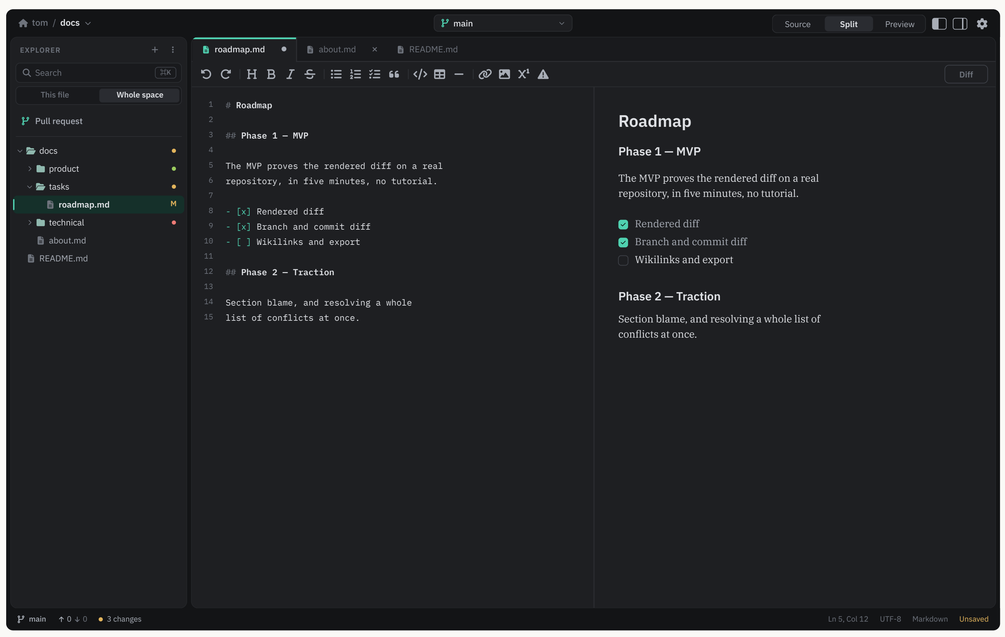

Said in three places
A dot in the tree, a dot on the tab where its close would be, and the words in the status bar. The mode bar stopped saying it — the tab says it closer to what it is about.

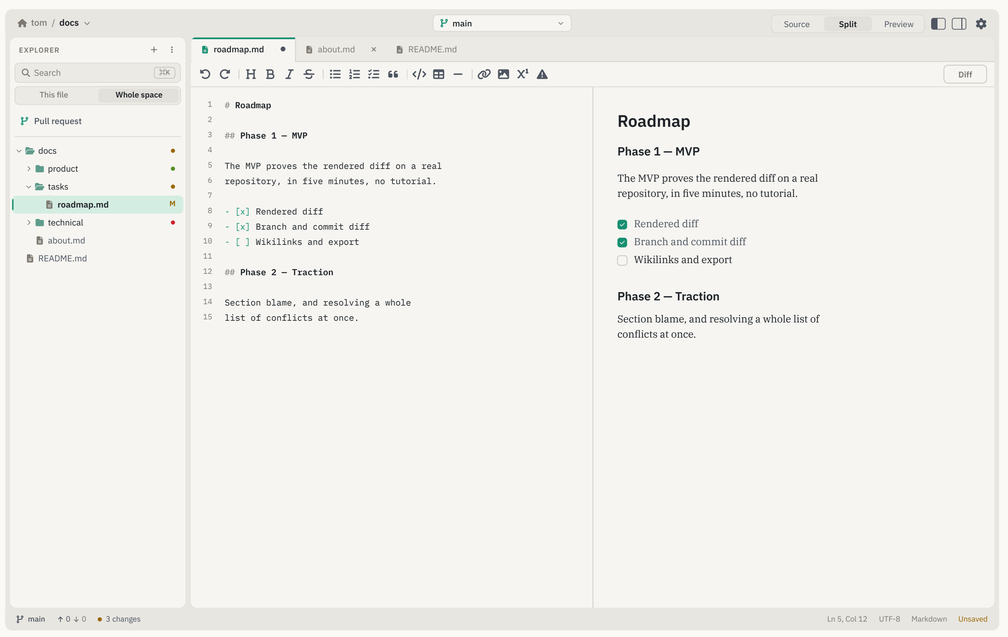

A refusal reads differently
"Not saved" is different news from an edit that simply has not been written yet.

The file is the true copy
Saving writes the buffer to disk; the app holds no state a reload could not rebuild.

Three ways of looking
Source, Split and Preview, and the choice belongs to the window, not the document.

Merged rows

Merged rows

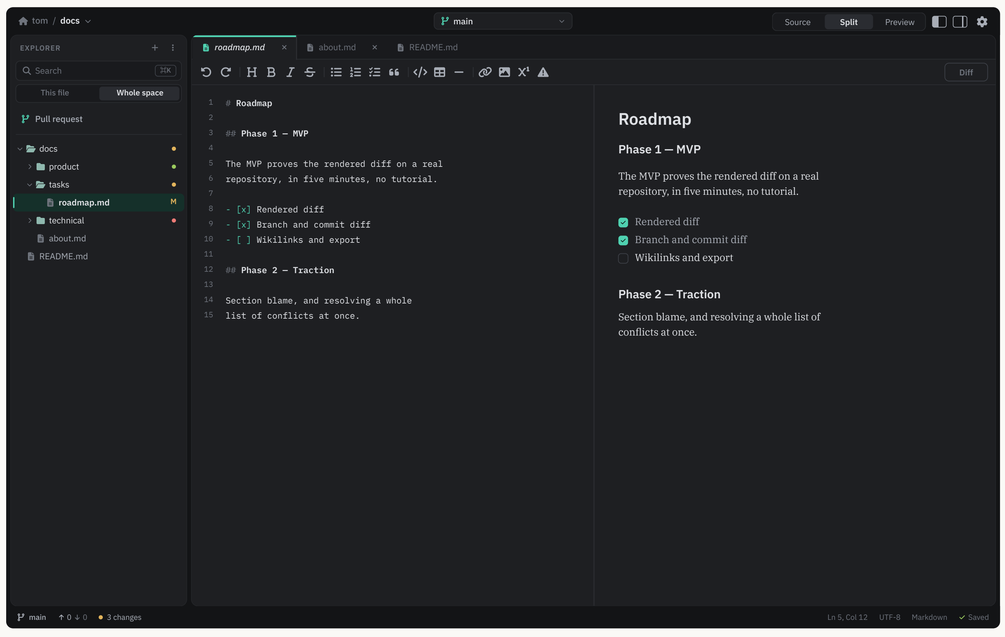

One row, tools left and view right
Seventeen formatting buttons in five groups, then Source · Split · Preview with the Diff chip at the end. Three rows of chrome above the document instead of four.

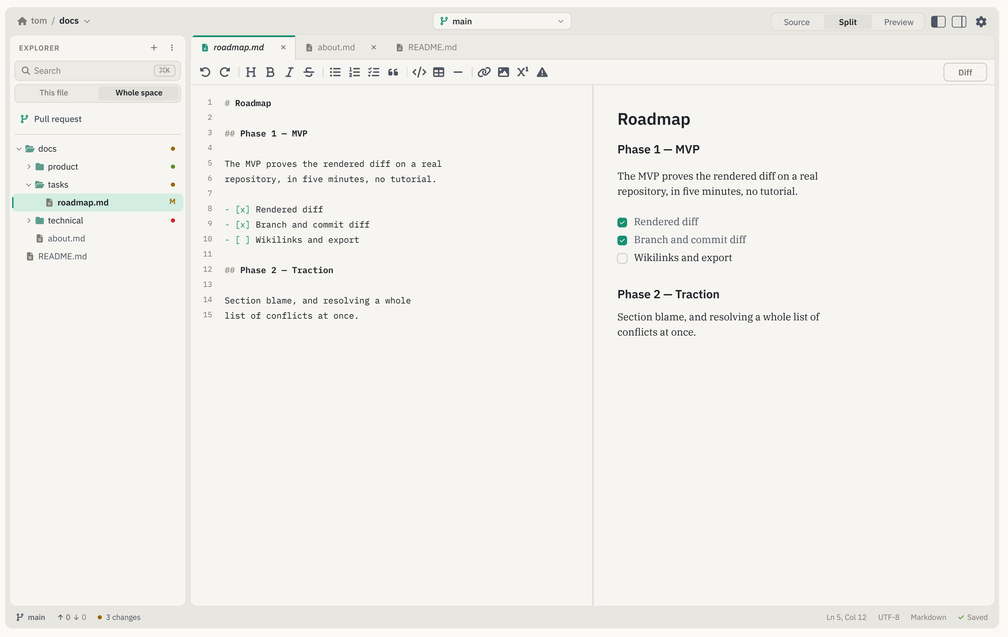

The tabs are a row of their own
Nothing shares it, and it touches the document: that join is what says a tab is the open document rather than a button that happens to be selected.

Both ends belong to the pane, not the window
The modes travel with the pane when a column opens. The centre was free while the row held nothing else, and a centred control in a full row is one the buttons run into.

The bar scrolls rather than drop a button
With the git column open the set is 34 points too wide. Dropping buttons by width would make the same bar mean different things on different screens.

Tab in preview

Tab in preview

Opening a file does not keep it open
A click from the tree opens it in preview, and the name goes italic. Somebody reading through a folder ends with one tab, not thirty.

There is never more than one
Opening the next file replaces this tab rather than adding one. It is a position, not a state several tabs can share.

Editing, saving or a double click keeps it
The italic goes and the tab stays. The act says the intent: a file somebody typed into is a file they meant to keep.

It has a close, because it has nothing to lose
A preview tab was never edited, so nothing is at risk — the close is drawn. The dot that replaces it belongs to the unsaved tab, which is a different thing.
