Preferences

The handful of choices that belong to the machine rather than to a space — and the popover that holds them.

Preferences

Preferences

It took the theme toggle's place

Dark mode lives in the popover now, so the bar trades one control for another instead of squeezing a fourth into the same margin.

A preference applies when it is chosen

There is no OK and no Cancel — press Dark and the window darkens behind the popover, so closing decides nothing.

It closes three ways, and one of them is visible

The button stays lit while the popover is open, so pressing it again closes it. Clicking outside and Esc do the same.

A popover, not a menu

A menu is a list of choices in tall rows. These are controls — a two-way choice, a select and a checkbox — and a menu would turn language into a submenu.

No scrim

Dimming would say the rest of the window is blocked, and the point is to watch the app change behind it. The scrim belongs to the dialog, which asks and waits.

The file can be opened

Preferences are one JSON object in application support, and the tool that edits files can edit that one too — outside the tree is fine.

Choosing a language

Choosing a language

Four to start, and a fifth is one line

English, Português, Español, Deutsch. The list is not the feature; what sits under it is.

The chosen one carries a tick

Colour is never the only signal, here as everywhere else.

Language is the one that is not just a key

A theme is a value written and read. A language means every literal the app shows becomes translatable, and no decision records that yet.

Formatting bar hidden

Formatting bar hidden

The tools go, undo and redo with them

What the preference hides is the tools, not half of them. The row itself stays, because it is also where the view is chosen.

The modes go back to the centre

They left it because the buttons ran into them; with the row empty that reason is gone. They line up with the branch selector directly above.

Stored like the rest

Three more keys in the JSON the settings capability already writes — no new store, and a preference belongs to the machine, not to the space.
