Workspace

How the panels sit together: explorer, document area, aside and status bar, all at once.

Shell

Shell

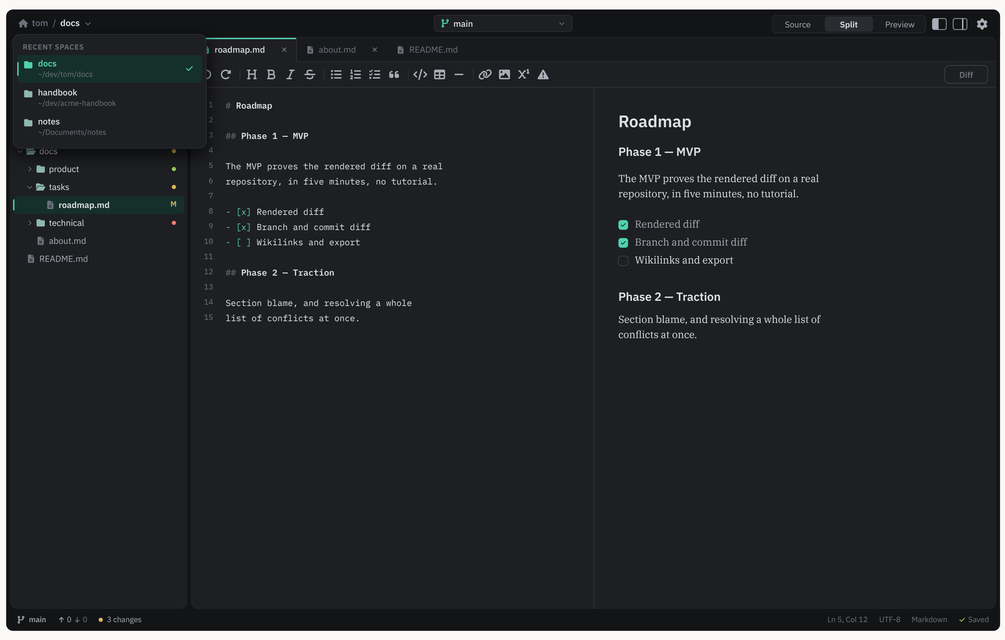

Everything at once
Explorer, document area and status bar are always on screen together.

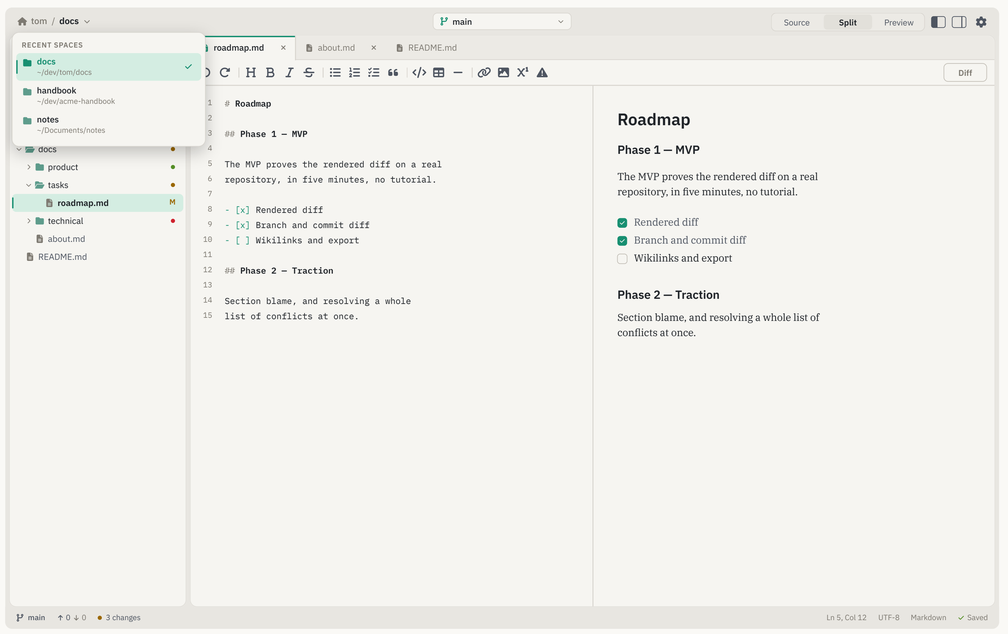

No full-screen takeover
The tree does not disappear while editing.

The regions never reorder
The regions never reorder, and every one of them keeps its edge. The columns can be dragged — the grip in the gutter is what says so — which is why the search screens show a wider explorer than the rest.

New panels join the layout
They are added here, never bolted on as a separate window.

Closing the space

Closing the space

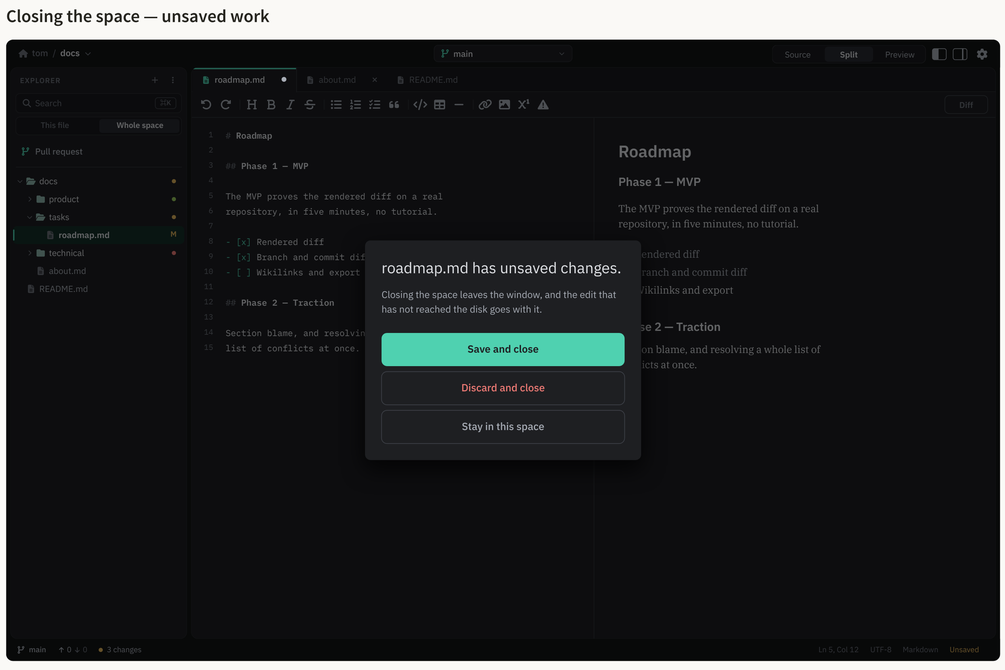

The space can always be left
The breadcrumb already names the space, so the way out needs nothing else in the bar.

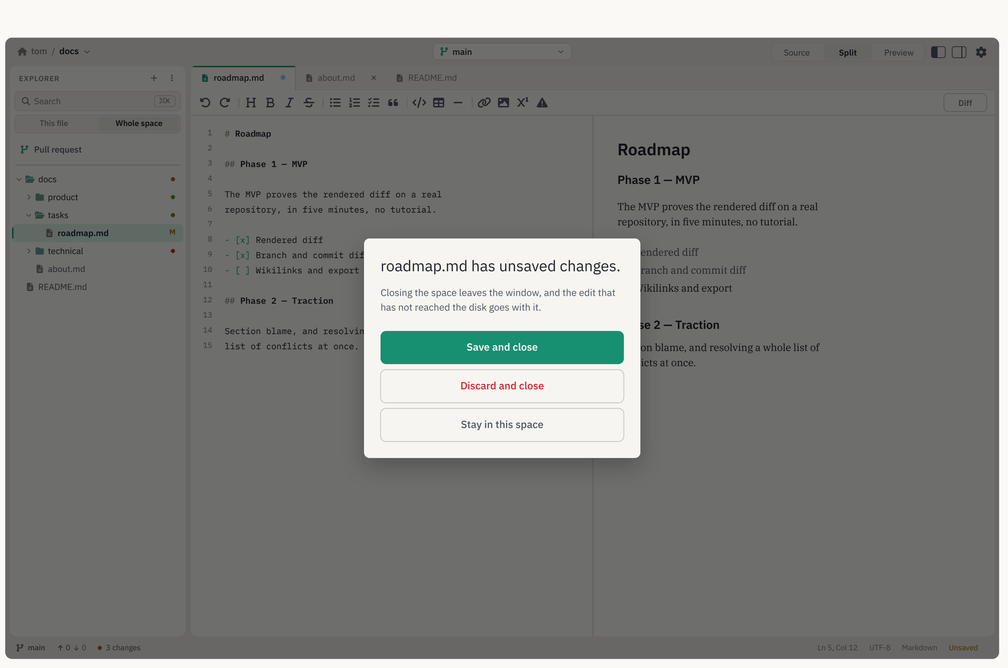

Switching skips the trip
Going to another space from the same menu avoids Home, which would be a step with nothing in it.

Closing returns to the opening screen
Where the recent list is waiting, each row naming the branch that space was left on.

One control, both jobs
The menu closes and it switches. A second button in the bar would say the two are different things.

Closing the space — unsaved work

Closing the space — unsaved work

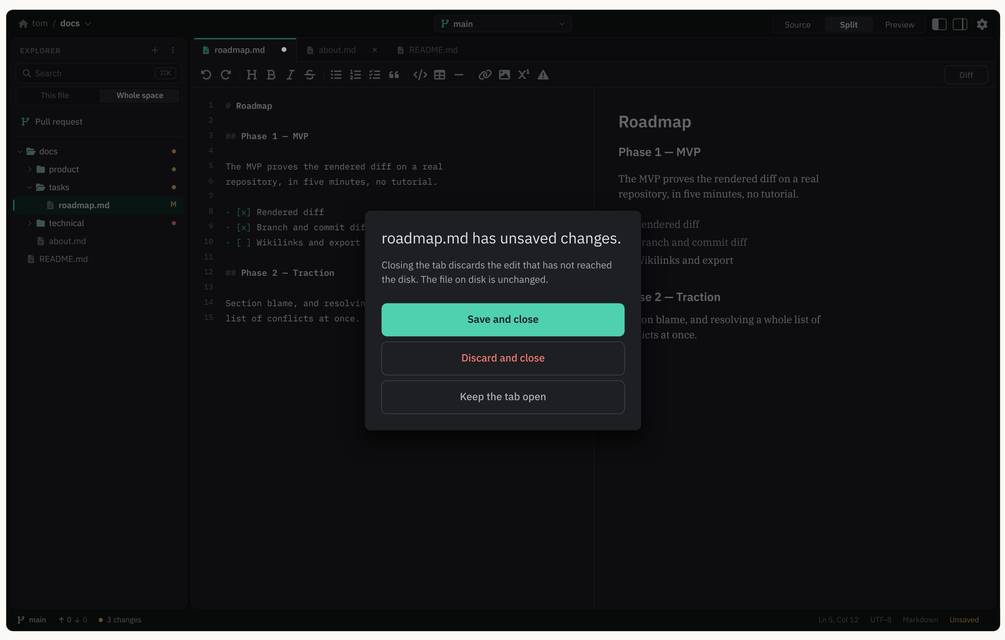

Closing with an unsaved buffer asks first
And names the document, so the question is about something specific rather than about work in general.

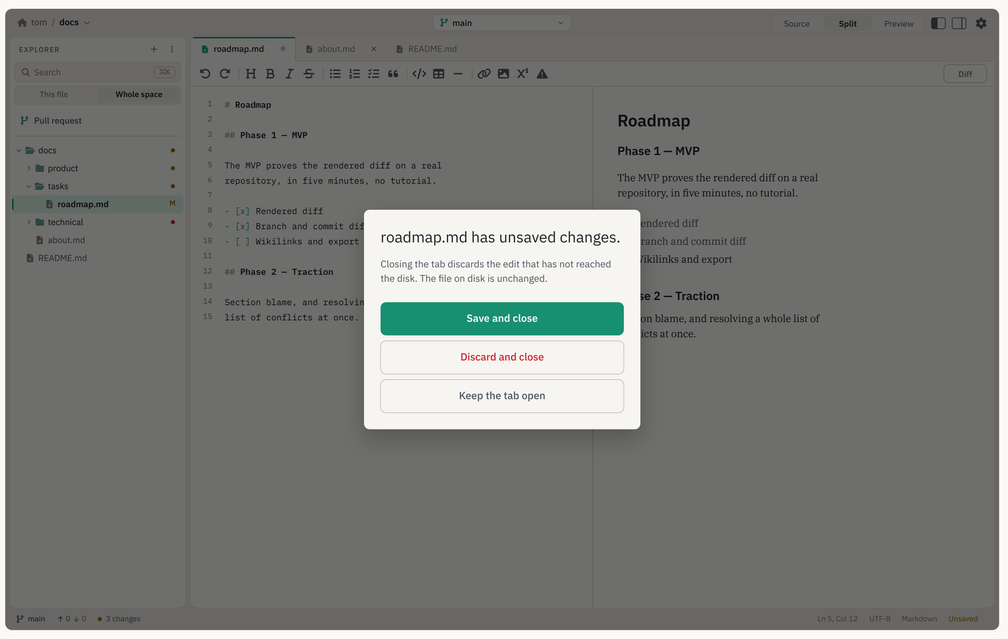

Stay sits beside save and discard
Three answers, because changing your mind about leaving is one of them.

The same question a branch switch asks
One wording for one situation, wherever it comes up.

Discarding is the re-read that follows
Nothing is deleted: the buffer is let go and the file on disk is read again.

Closing a tab · unsaved

Closing a tab — unsaved

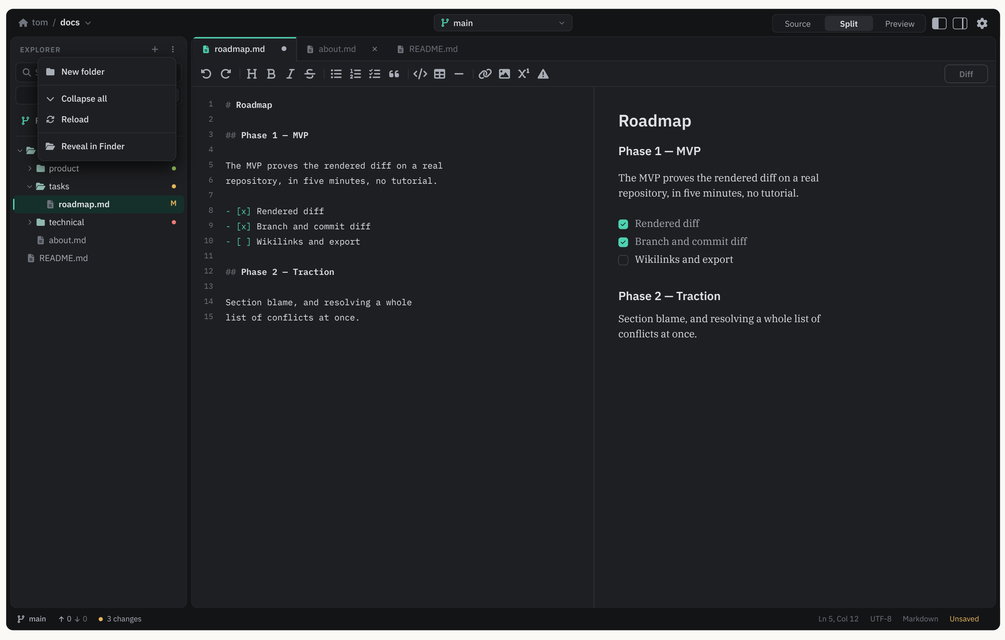

The strip has no close, the keyboard still does
The dot takes the place of the ✕ so no stray click discards work — but the shortcut is not going away, so it asks instead of refusing.

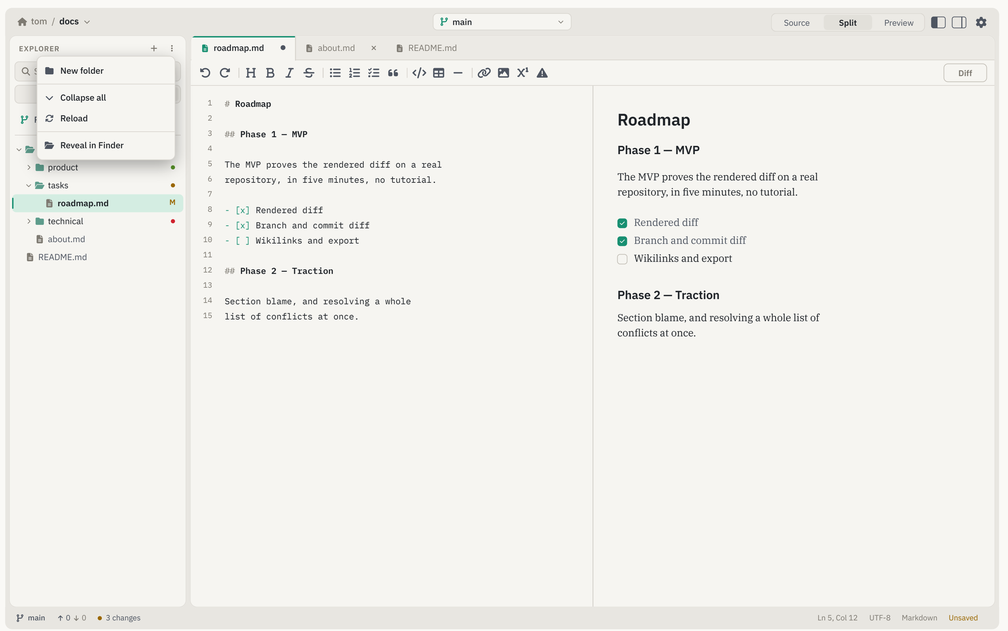

The same question leaving a space asks
Save and close, discard and close, or keep the tab open. One wording for one situation, about one tab instead of all of them.

A dialog, centred, over a scrim
It asks and waits, which is what the scrim says. Nothing behind it can be touched until it is answered.

Discarding is a re-read, not a delete
The buffer is let go and the file on disk is read again — the file was never the thing at risk.
