Git · no repository

Before a space is open: the three ways in, and what was open before.

No repository

No repository

The folder opens

It is a space like any other: the tree lists it, documents open, the preview renders, search finds and a save writes. Only the versioning is absent.

One place says why

The right column carries a glyph and two sentences — not inside a Git repository, nothing here is versioned — and nothing else on screen repeats it.

A control that cannot work is not drawn

No `Git · History` switch, no changes list, no message box, no commit, fetch or push, and no branch in the breadcrumb.

This revokes a named failure

Refusing the folder was the app deciding that a space without history is not worth opening, which is the opposite of what this product is for.
