Pull request

Writing the pull request for this branch, and opening it — the description is markdown, so it is written here.

Writing a pull request

Writing a pull request

The description is markdown

So it is written here, with the editor, the preview and the formatting bar the rest of the app already has.

The page takes the whole editor

The tab strip goes, and the row it had says whether the pull request can be opened and what stands in the way.

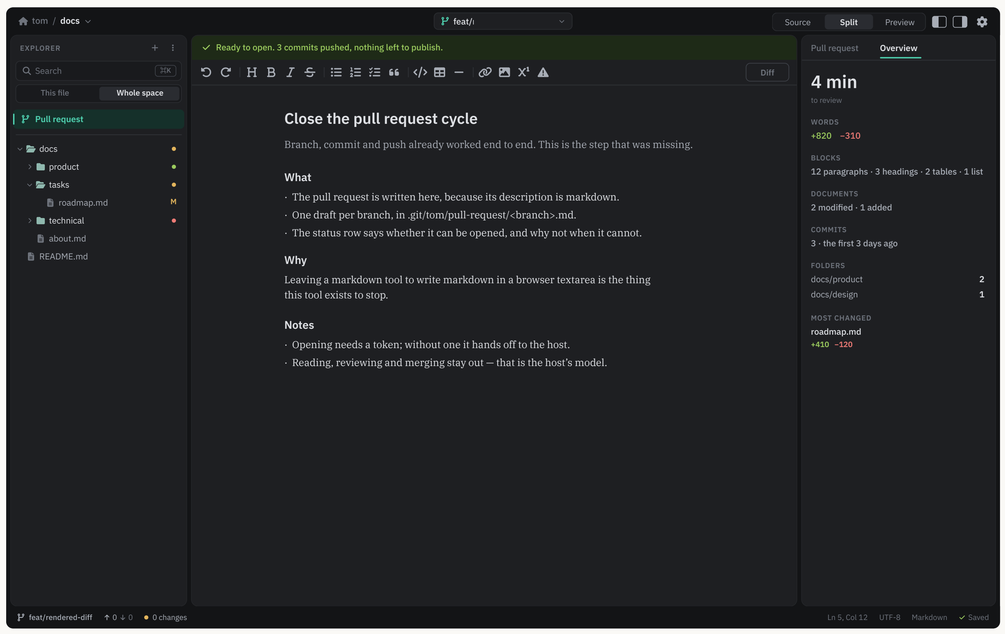

The title is the first heading

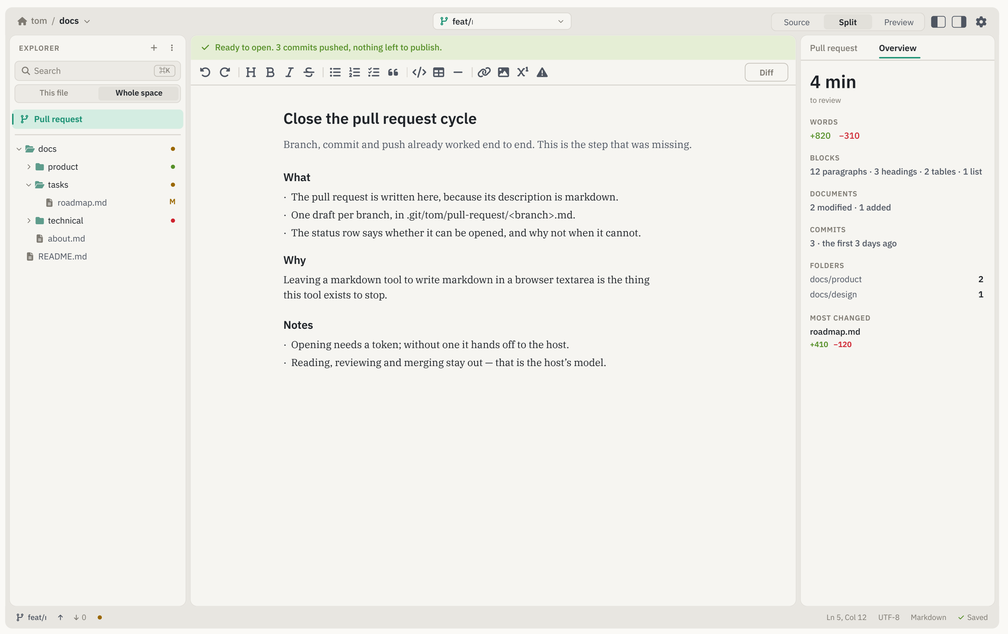

There is no title field: the document's own first line is the title, the way every other markdown document works.

One draft per branch

It lives in .git/tom/pull-request/<branch>.md — it survives the window, and it is never committed.

Branch overview

Branch overview

Words, blocks and reading time

The three numbers only this tool can give, because prose is measured in words and blocks, never in lines.

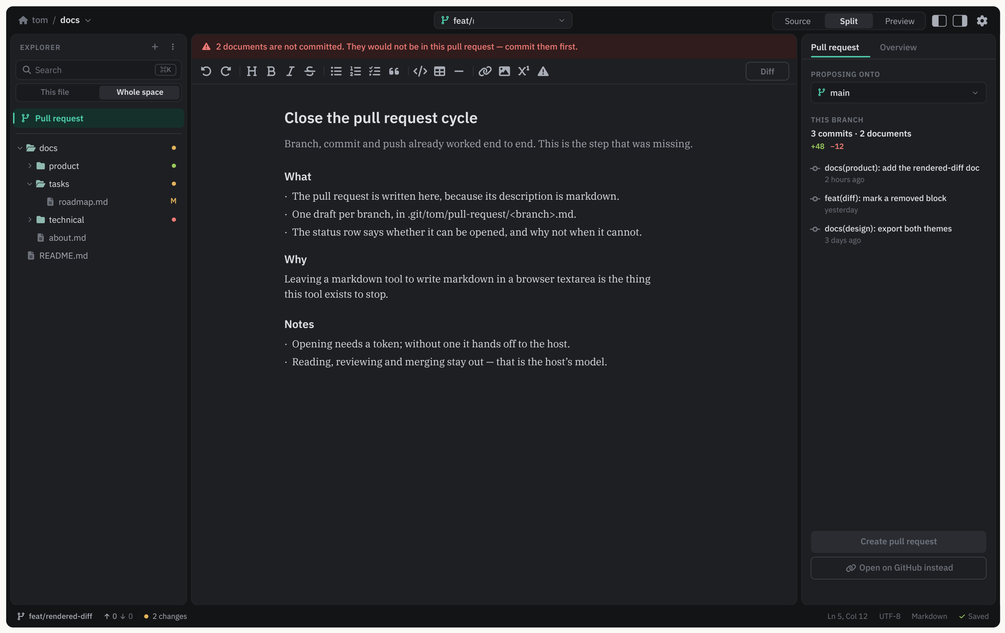

The rest is read from git

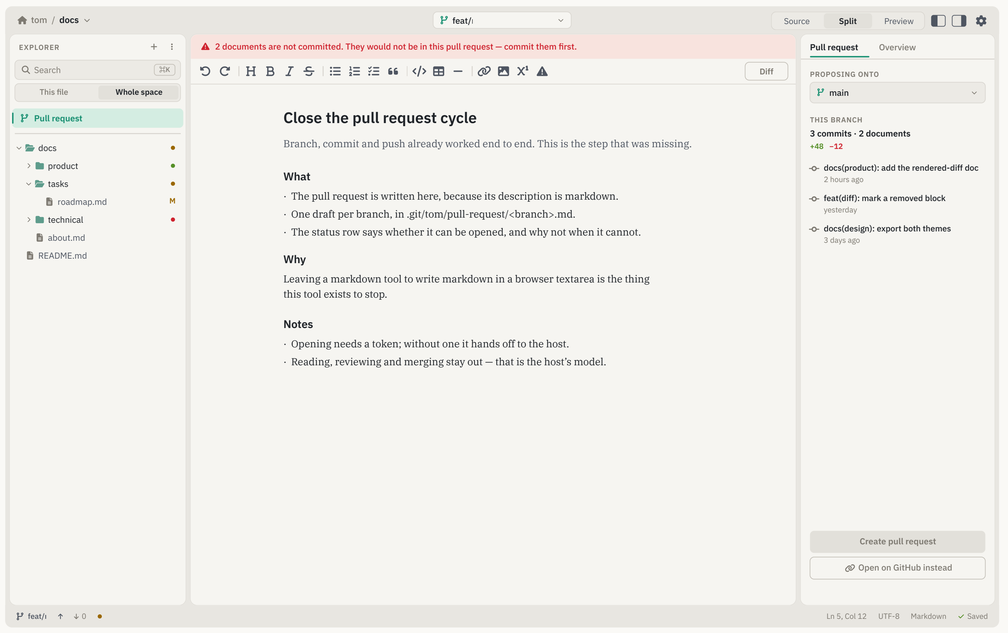

Documents, commits, folders and the most changed file come from log and diff --stat; nothing here is counted twice.

No action on this segment

Opening belongs to the other one. This side only reports.

Cannot open yet

Cannot open yet

Uncommitted work blocks it

A guard, not a limit: git would allow it, and the edit simply would not be in the branch that is proposed.

Both actions go unavailable

A guard with a second door beside it is not a guard, so the hand-off to the host is refused too.

The row names the consequence

It says what would happen rather than claiming something is impossible.
