

Search

Finding a document by what it says, not by what it is called.

Searching · every document

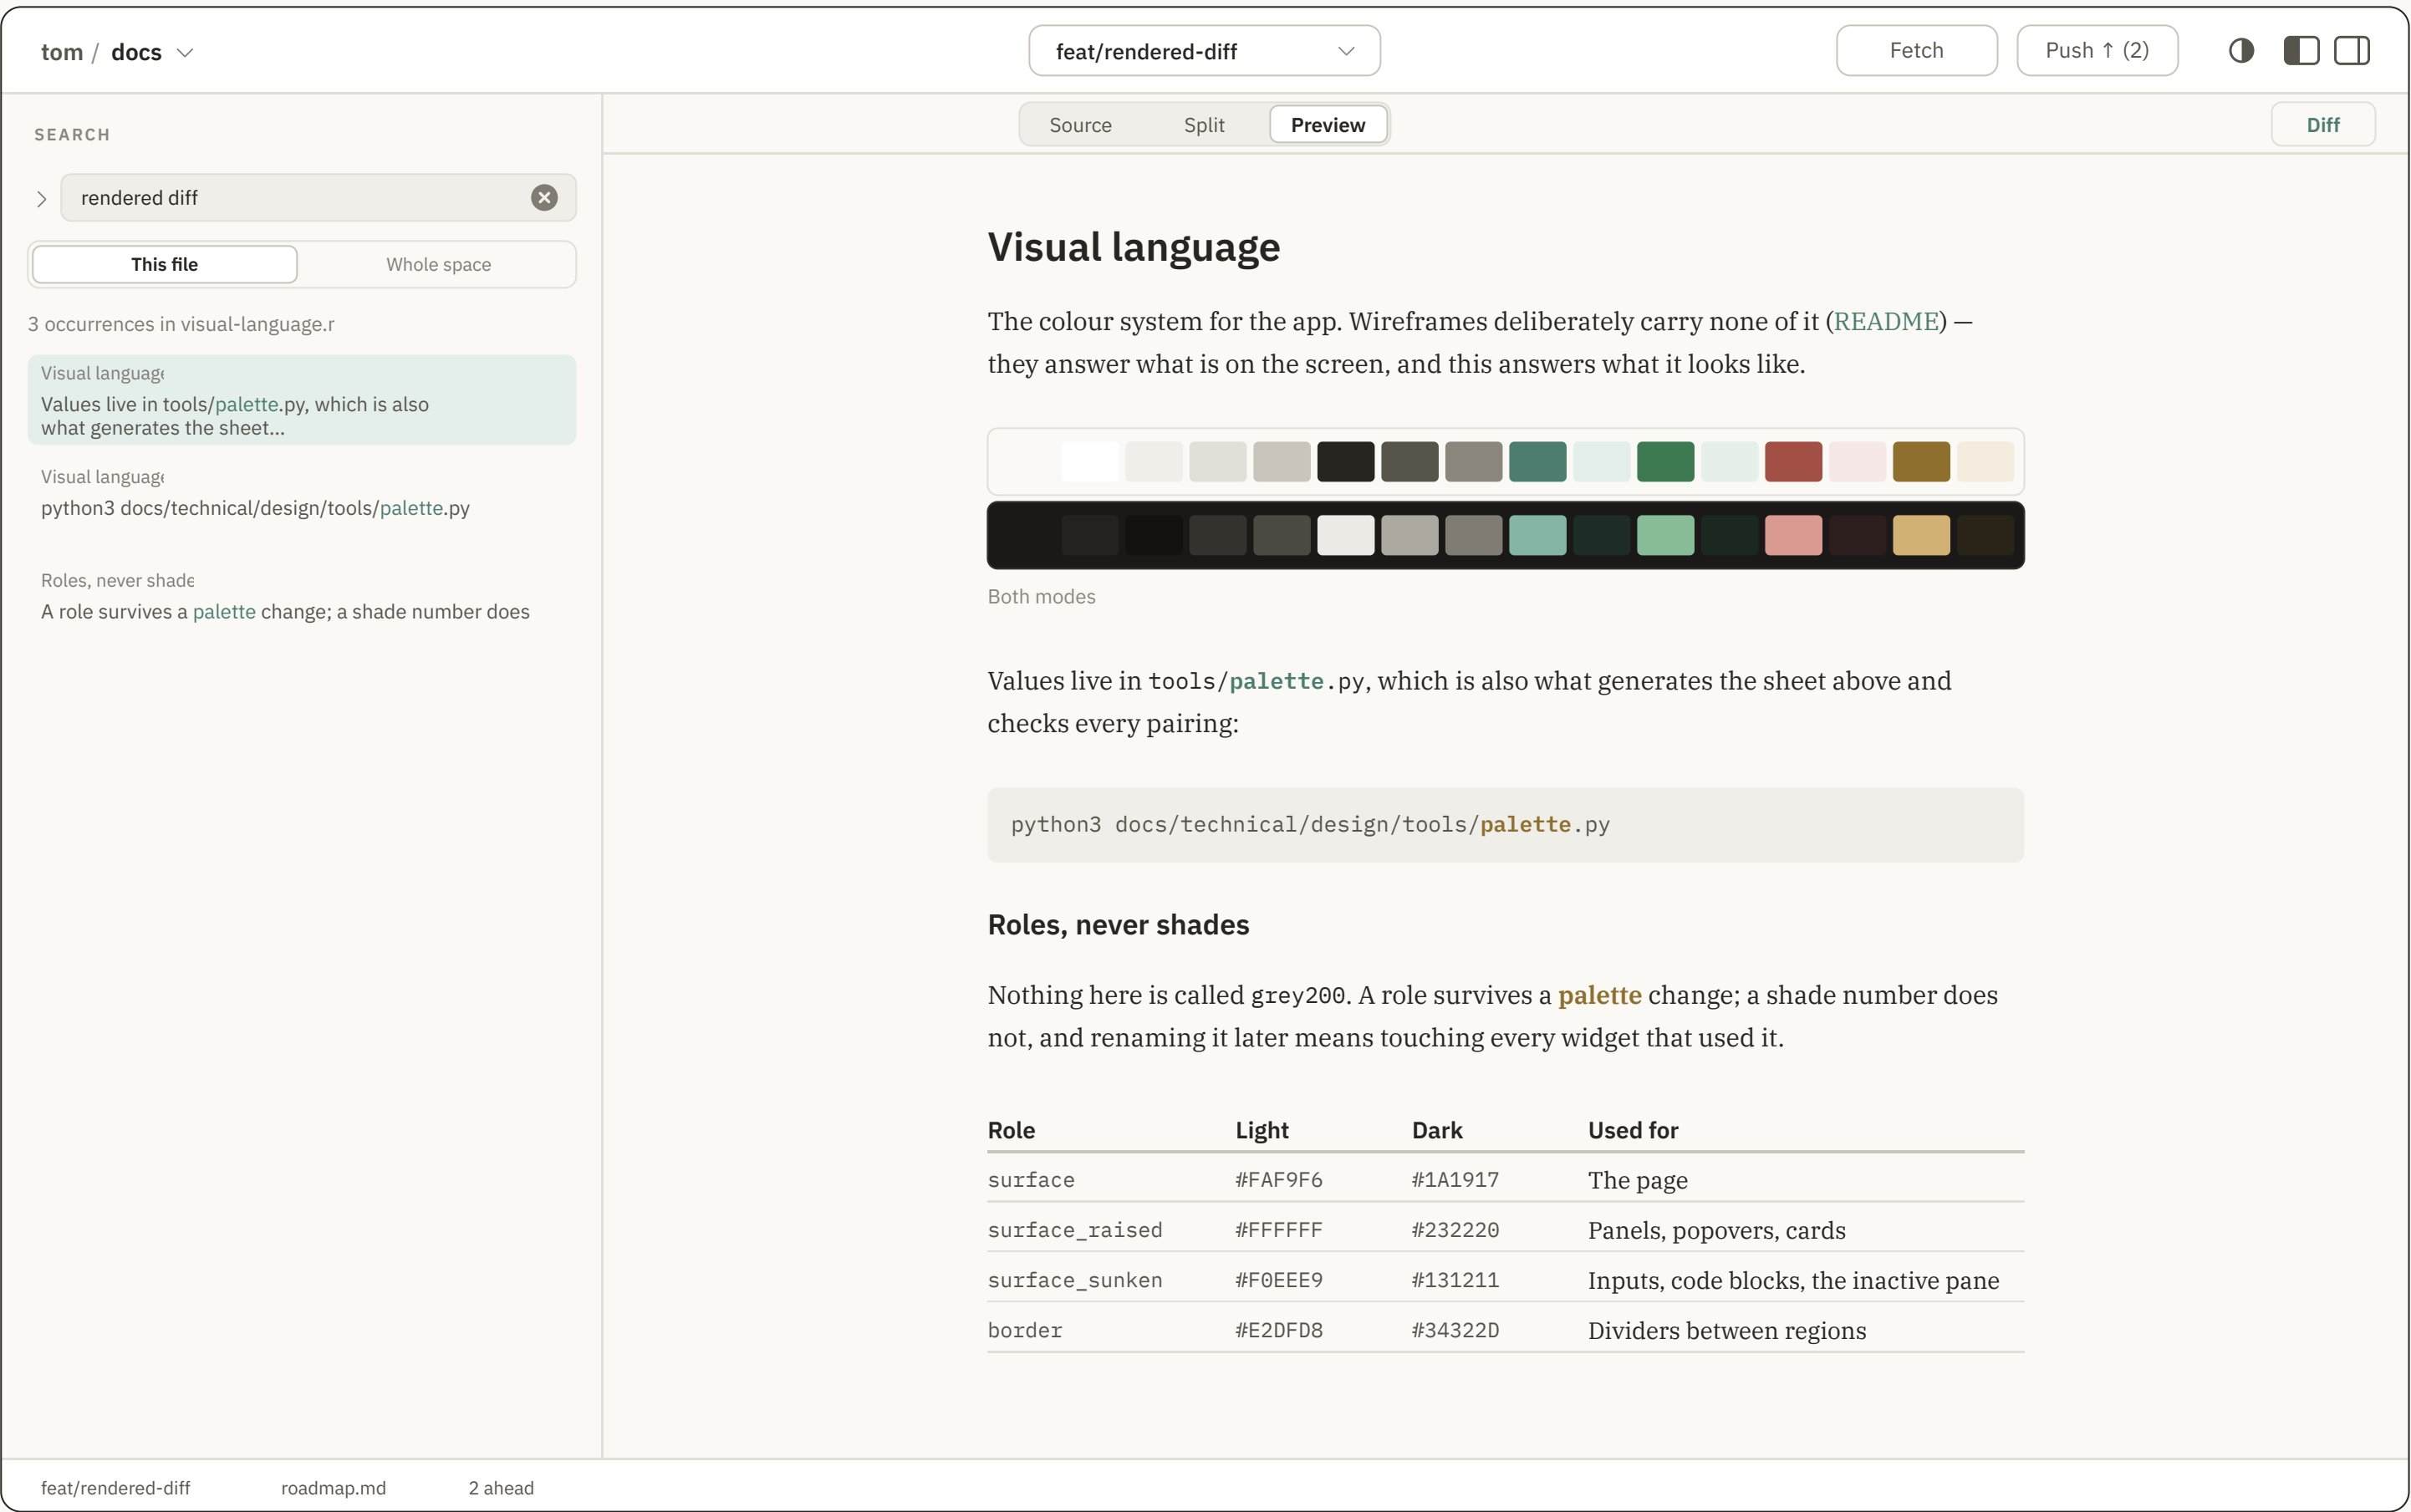

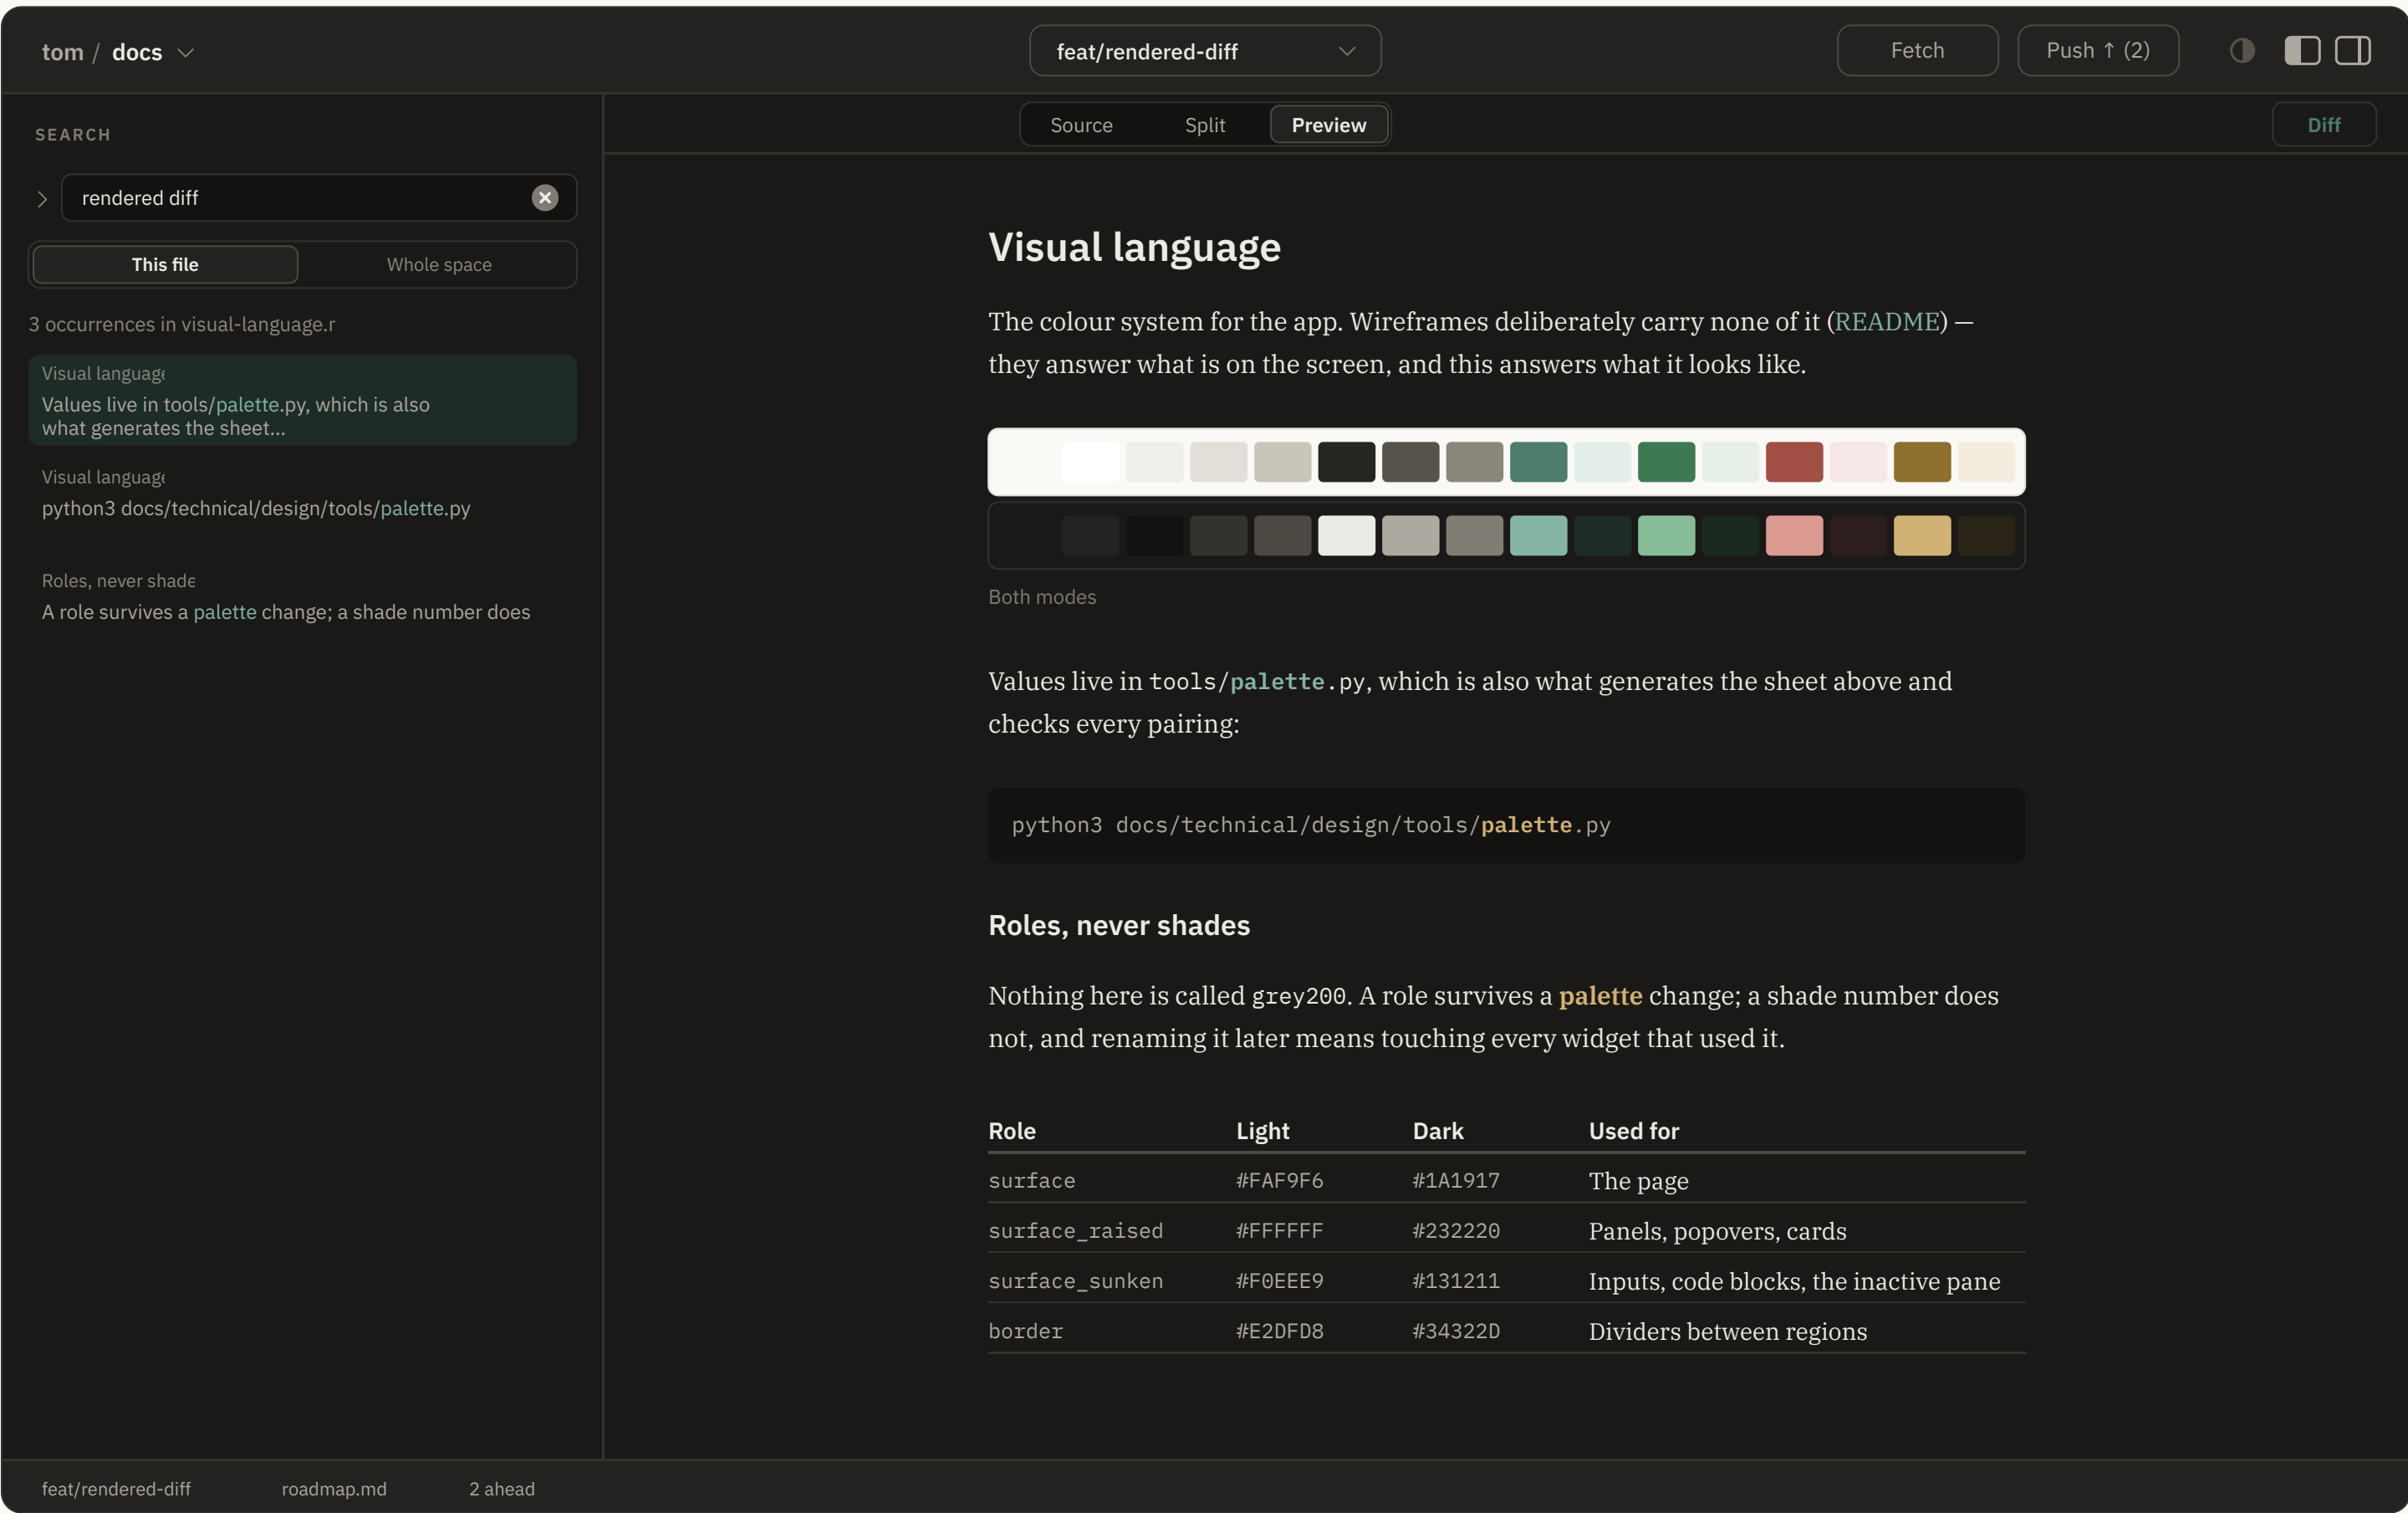

Searching in every document

Contents, not file names
Every markdown file in the space, by what it says.

One column, one conversation
The box and what it found are next to each other, in the column you navigate from.

The index is a cache
Delete it and reopening the space rebuilds it from the files on disk.

Searching · the open file

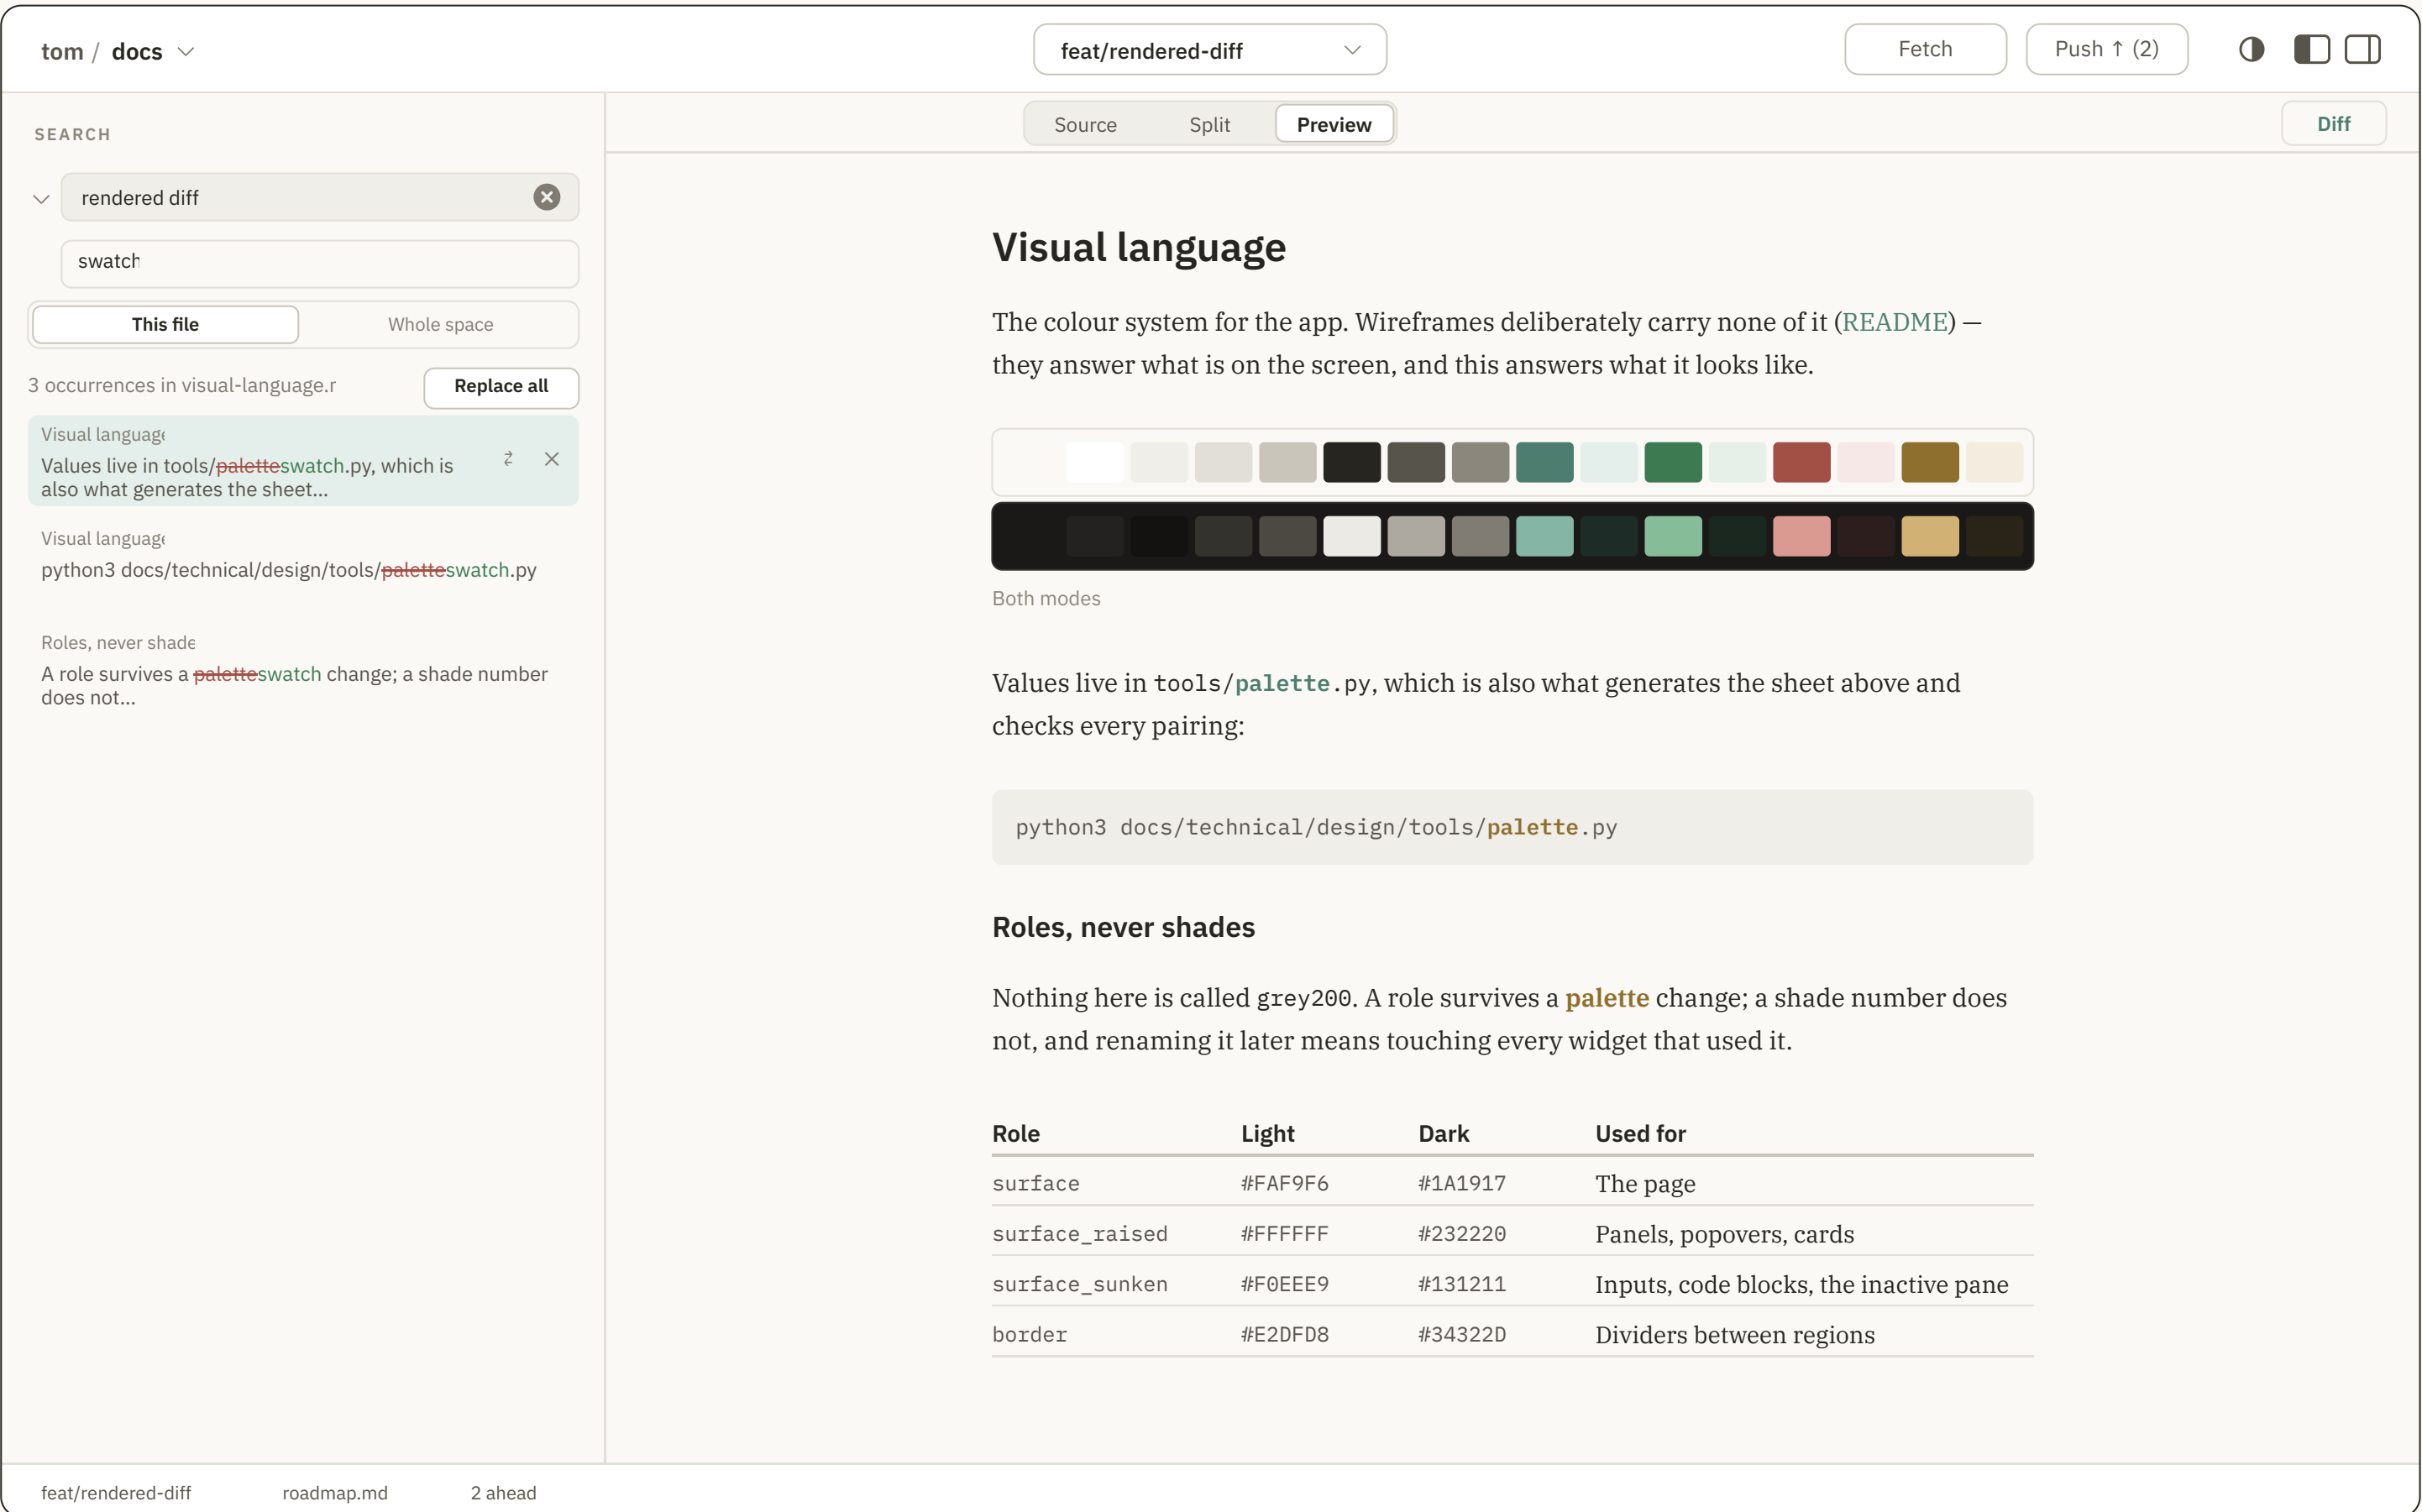

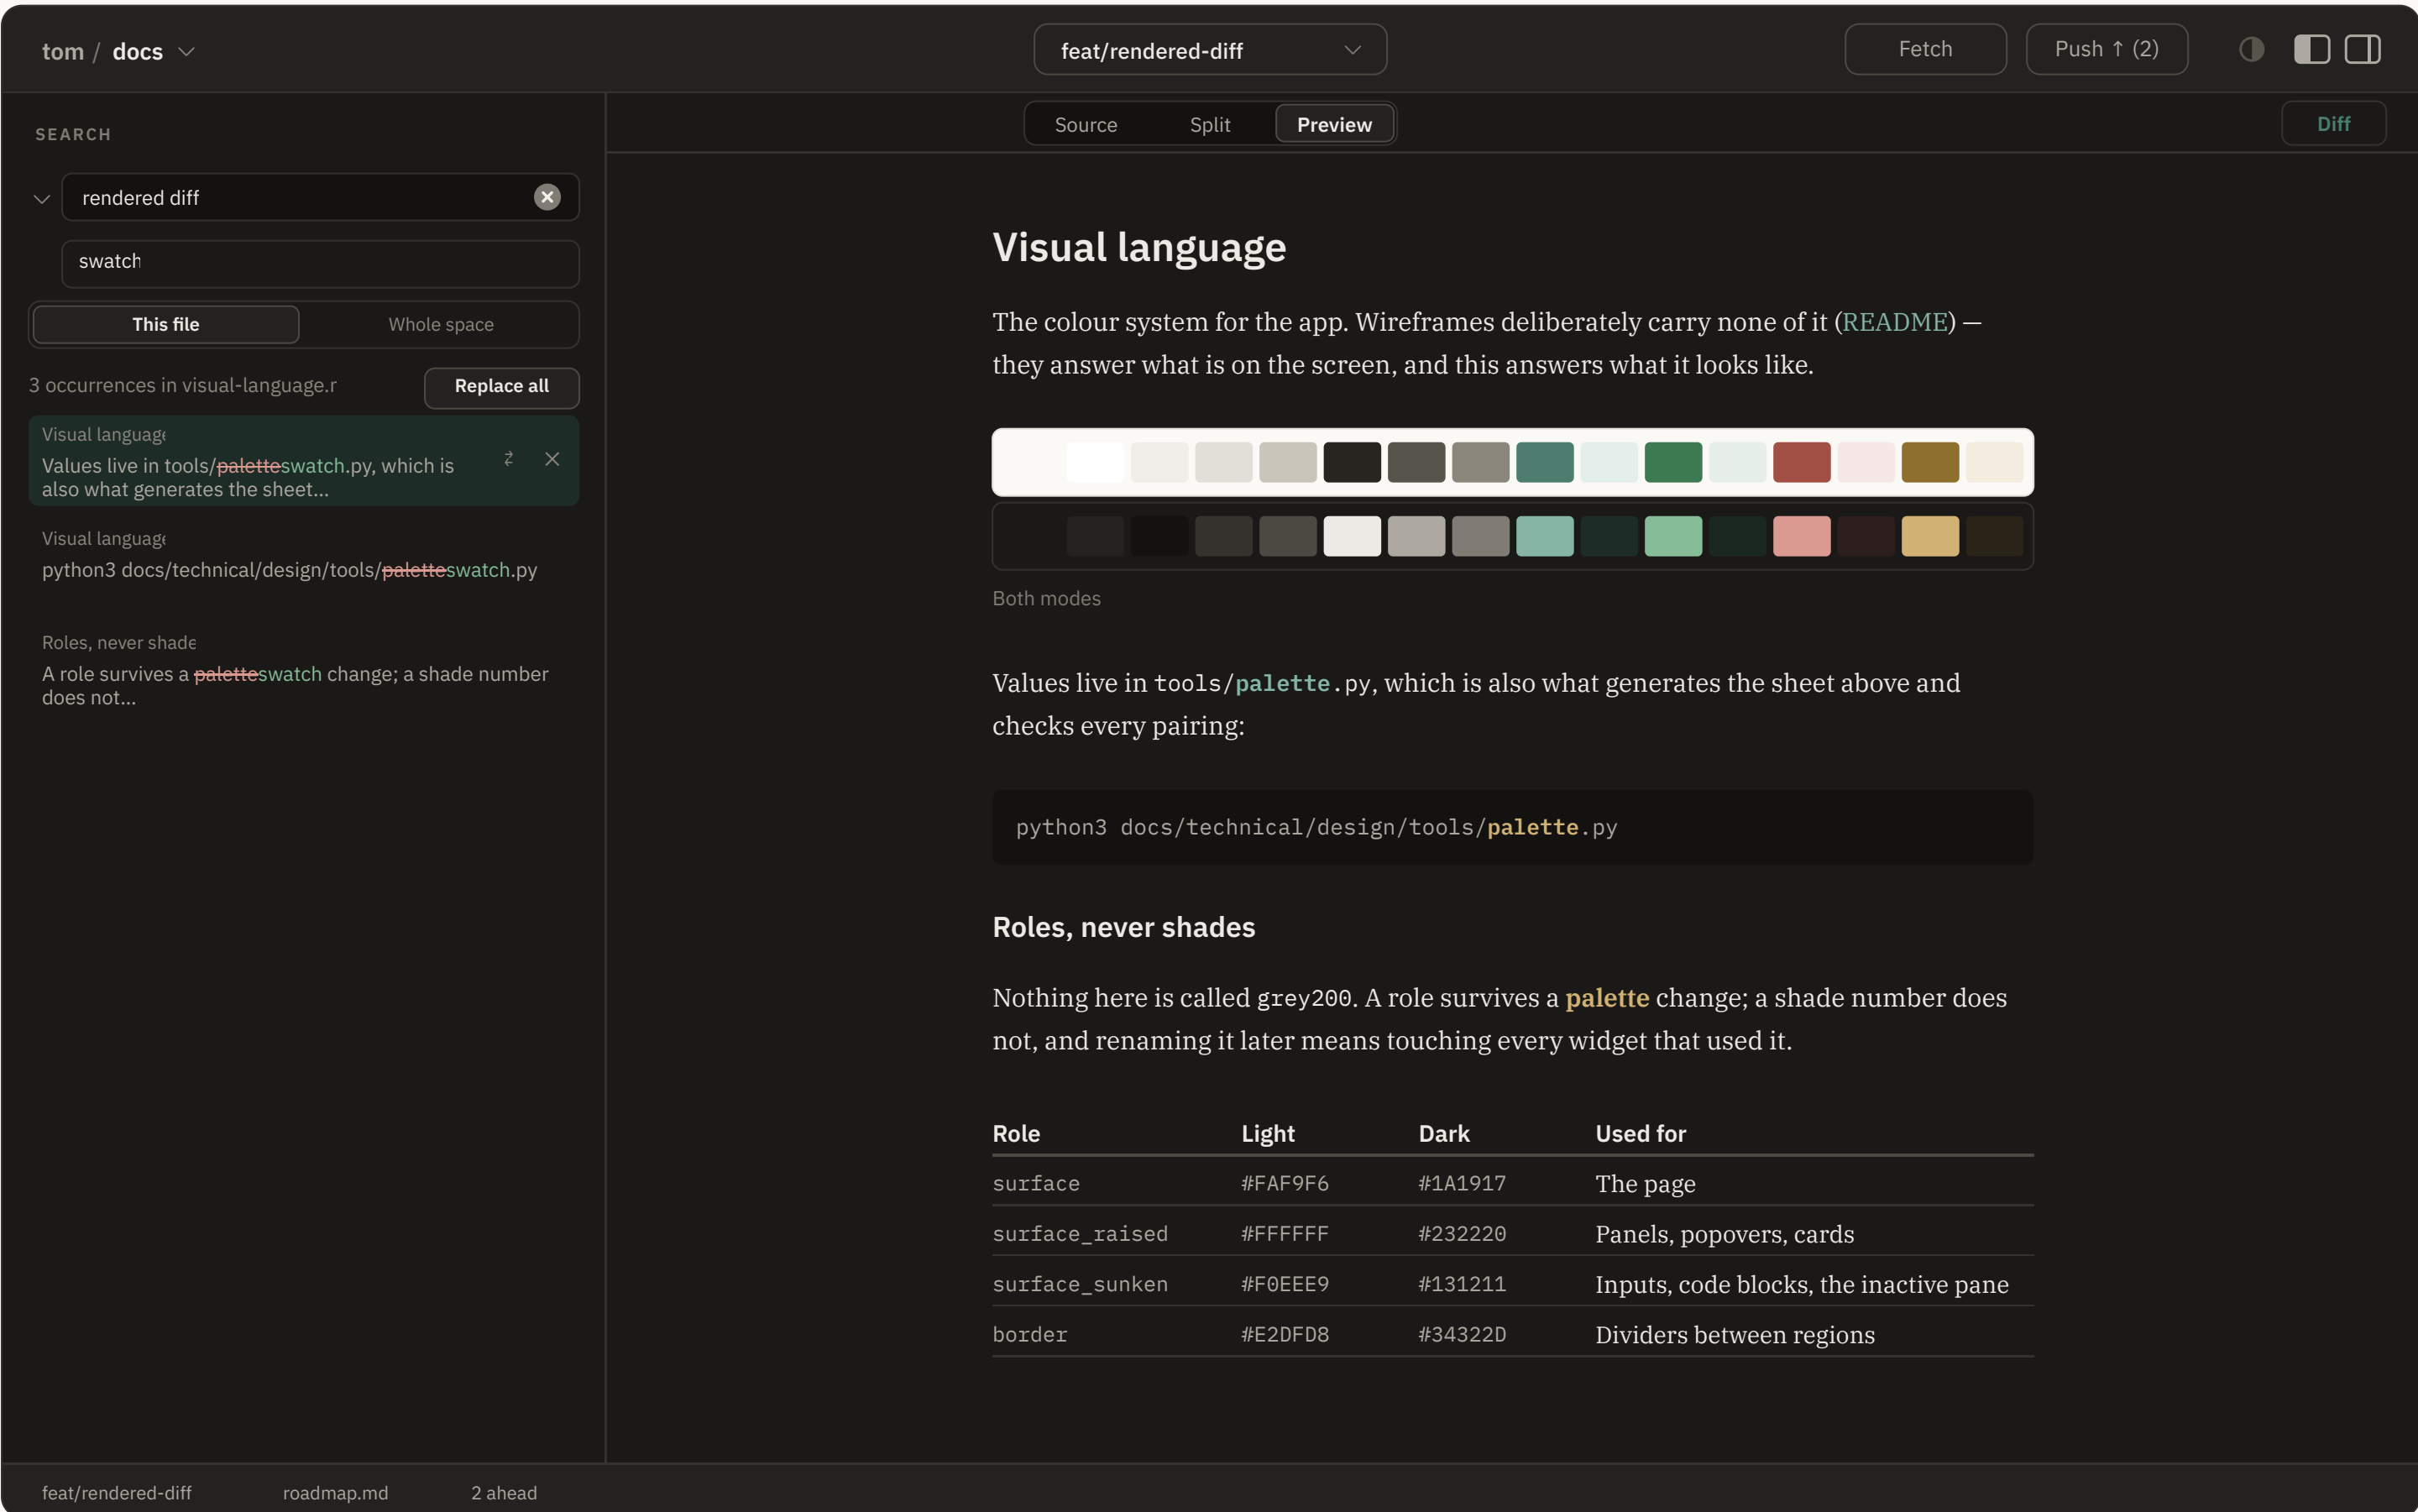

Searching in the open file

The same box, a different reach
Scope decides whether the answer is a list of documents or a list of occurrences.

Every occurrence, in order
The line it is on and the words around it, so you know which one it is before you go.

Lit where it is
The matches stay marked in the document, with the selected one stronger than the rest.

Searching · with replace

Searching with replace

Folded away by default
Most searching is reading, so replace waits behind a disclosure.

One, or all of them
Two buttons, because replacing the occurrence you are on and rewriting the file are different risks.
